BMMSS Challenge of the Day

You are trying to find the absolute best parking spot on campus. There are 100 sequential spots available in a single-file line. You drive by them one by one, and once you pass a spot, you cannot turn back or change your mind.

If you pull into a spot, that is your final choice. Your goal is to maximize the probability of selecting the single absolute best spot.

The Question: What fraction of the parking lot (x) should you just observe and drive past before you are allowed to pick the very next spot that is better than anything you have seen so far?
